2. Product

2.1 Product description / Product definition

Glavaflex is a flexible closed cell rubber insulation made of flexible elastomeric foam (FEF) that prevents condensation and reduces energy loss. By incorporating a water vapour barrier into the insulation cell structure Glavaflex can effectively eliminate water vapour migration and retain outstanding performance over the entire system life. This EPD covers the Glavaflex product family including Glavaflex tubes, coils, and sheets.

For the placing on the market of the product in the EU/EFTA (with the exception of Switzerland) Regulation (EU) No. 305/2011 (CPR) applies. The product needs a declaration of performance taking into consideration /EN 14304:2009/ and the CE-marking. For the application and use the respective national provisions apply.

2.2 Application

Glavaflex is used for air-conditioning, refrigeration, chilled water, heating and hot water pipes and air distribution ductwork. In addition to preventing condensation and saving energy, Glavaflex also

performs an acoustic function, absorbing sound and dampening duct wall vibration. With inherent anti-microbial resistance as standard, and a Class B fire rated, closed cell rubber that is completely dust and fibre free, Glavaflex can be used in any kind of public, commercial or industrial building without impacting on health or the quality of air. Outdoor application requires protection against UV-radiation.

2.3 Technical Data

Constructional data

Name	Value	Unit
Gross density	48.35	kg/m ³
Water vapour diffusion resistance factor acc. to EN 12088	$\mu \geq 10000$	-
Thermal conductivity	$\lambda \leq 0.034 + 7.2 \cdot 10^{-5} \rho + 1.2 \cdot 10^{-6} \rho^2$	W/(mK)
Thermal conductivity at -10 °C	0.033	W/(mK)
Thermal conductivity at 0 °C	0.034	W/(mK)
Thermal conductivity at 10 °C	0.035	W/(mK)

Performance data of the product in accordance with the declaration of performance with respect to its essential characteristics according to /EN 14304:2009/.

2.4 Delivery status

Glavaflex is supplied in the shape of tubes and sheets:

- Tube $d_N = 6 - 50$ mm
- Tube – Self-adhesive $d_N = 6 - 50$ mm
- Tube continuous $d_N = 6 - 50$ mm
- Sheet continuous – roll $\varnothing 400$ mm
- Sheet continuous – roll $\varnothing 530$ mm
- Flat sheet (2.0 x 1.0 m) $d_N = 3 - 50$ mm

The EPD is based on the average of these six different versions. Glavaflex is typically packaged in containerboard boxes or polypropylene bags and delivered on EURO pallets. Some product varieties are wrapped in polyethylene film before packaging.

2.5 Base materials / Ancillary materials

Glavaflex is based on synthetic rubber and consists of several components. The following table shows the components clustered into substance groups:

- Rubber and polymers: 27.6%
- Fillers and pigments: 21%
- Blowing agent: 13%
- Vulcanisation system, additives, plasticizer: 3.5%
- Flame retardant: 34.5%
- Stabilizer: 0.4%

Rubber and polymer are the base material. Fillers and pigments are for firmness and colour. The blowing agent causes the volume increase and expansion process during the manufacture of the product. The vulcanisation system, additives, and plasticizer sure flexibility and workability. The flame retardants ensure the fire resistance of the end-product, and the adhesives and stabilizers are for processing and process control.

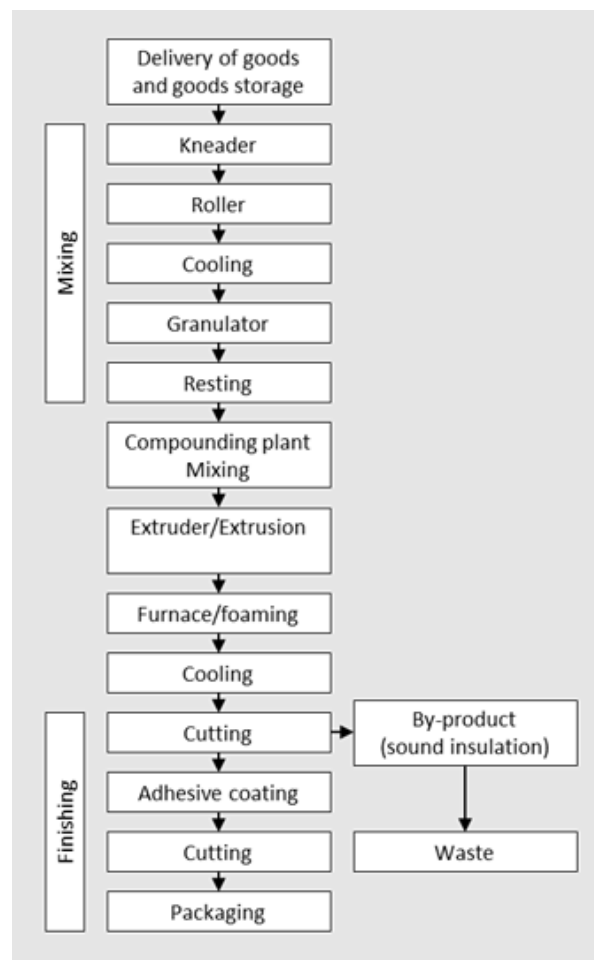

This product contains a substance listed in the candidate list of Substances of Very High Concern for authorization (/SVHC/) (date: 10.04.2019) exceeding 0.1 percentage by mass under the chemical law (/REACH/).

- Name of the substance: Azodicarbonamide
- CAS-number: 123-77-3
- Percentage by mass: 13
- Hazardous properties: may cause allergy or asthma symptoms or breathing difficulties if inhaled

2.6 Manufacture

Upon delivery, the raw materials are stored in a warehouse and used in the production shortly after. The first step in the production of Glavaflex is to mix the raw materials in a kneader and to roll-out the resulting mixture which is then cut into sheets. The flat

sheets are passed through an industrial cooler and cooled-off. The cooled-off sheets are granulated and the granulates are temporarily stored at room temperature before entering the compounding plant. In a next step, the different types of granulates enter the compounding plant for mixing. The resulting elastomer compound is pushed through extruders and carried on a conveyor belt through an industrial furnace for foaming. After foaming, the endless sheets are passed through an industrial cooler upon which a continuous longitudinal cut is applied to cut sheets into the right width. If applicable, adhesive coating is applied on one side of the sheets. Finally, a traverse cut trims the continuous sheet into sheets of various sizes. For the packaging, cardboard, polyethylene film, polypropylene film, and wooden pallets are used.

2.7 Environment and health during manufacturing

The environmental management system is certified in accordance with DIN ISO 9001/14001/50001.

2.8 Product processing/Installation

The installation of Glavaflex requires basic tools such as cutters and scissors. No additional specific protection, beyond normal protective clothes, is required.

2.9 Packaging

Glavaflex is packaged in cardboard boxes with polypropylene and polyethylene films in varying sizes. The boxes are placed on wooden EURO pallets.

2.10 Condition of use

Changes in materials composition of Glavaflex during the use phase only occur in case of extraordinary effects.

2.11 Environment and health during use

An odour should be considered normal. The odour will dissipate during use (about 4 weeks) because the cells are exchanged with the air.

2.12 Reference service life

Since the use stage (B1-B7) is not fully declared, the declaration of the reference service life is only voluntary.

2.13 Extraordinary effects

Fire

Glavaflex is designed to meet European fire regulations and is a self-extinguishing foam that will not drip or support flame spread. It can be safely used with confidence in public, commercial and industrial buildings.

Fire protection

Name	Value
------	-------

Building material class	B (sheets) / BL (tubes)
Burning droplets	d0
Smoke gas development	s3

Water

Mechanical destruction

2.14 Re-use phase

At the end-of-life, Glavaflex can be used for energy recovery in a waste incineration plant, as well the plastic from packaging. The cardboard and wooden pallets from packaging can be re-used.

2.15 Disposal

Glavaflex is disposed in accordance with local regulations governed by the European Waste Catalogue (waste code: *07 wastes from organic chemical processes - 07 02 13 waste plastic*).

2.16 Further information

Additional information about Glavaflex are available on <https://www.glava.no/tema/teknisk-isolering/glavaflex>.

3. LCA: Calculation rules

3.1 Declared Unit

The declared unit is 1 m³ of the thermal insulation material for technical building equipment and industrial installations Glavaflex including packaging materials. The declared unit refers to the product as it leaves the factory gate. The gross density is the average density of all declared products, weighted by production volume.

Declared unit

Name	Value	Unit
Gross density	48.35	kg/m ³
Conversion factor to 1 kg	0.20683	-
Declared unit	1	m ³

3.2 System boundary

The system boundaries of the EPD follow the modular structure of EN 15804 (according to /EN 15804/, section 6.2.1). Only the declaration of the product stage modules A1 to A3 is mandatory for compliance with EN15804. The declaration of the modules of other life cycle stages is optional. Resources from the ecosphere and Technosphere enter the system on stage A1 and leave the system on stage C4. The following life cycle stages are considered:

Module A1: The system boundaries comprise raw material extraction and supply from cradle to factory gate and is represented through generic background data sets.

Module A2: The transport of the raw materials from the factory gate to the point of manufacturing is represented through generic background data sets. The transportation distances have been provided by the manufacturer.

Module A3: The manufacturing includes manufacturer specific material and energy data which are represented through generic data sets. Machinery as well as buildings to manufacture the declared unit are neglected. On average, 0.49 kWh electricity and 2.65 kWh natural gas are required for the manufacturing of 1m³ Glavaflex. This data was provided by the manufacturer. This module also includes packaging with plastics and cardboard and wooden pallets. The biogenic carbon stored is declared in the result section.

Module A4: The transport of Glavaflex from the factory gate to the site of assembly is represented through generic background data. The transportation distances are based on average transportation data provided by the manufacturer.

Module A5: The assembly can be done manually without use of any electrical equipment. Only glue is required for the assembly of Glavaflex. Packaging material from module A3 is disposed here: Plastic packaging is incinerated, and cardboard and the wooden pallet are re-used.

Module C2: The products to be disposed are transported to the waste treatment facility.

Module C4: The waste is treated according to the waste framework directive of the European Union.

Module D: Potential impacts and benefits from energy recovery and recycling are described.

3.3 Estimates and assumptions

The type of EPD is cradle to gate.

Module A2: Raw materials are transported to the manufacturer by road transport and shipping. Information on the transportation distances were

provided by the manufacturer. For the calculation, the distances were weighted by the mass of the respective raw materials.

Module A3: No production waste is assumed during the production of Glavaflex. For further information, see chapter the Allocation. The packaging materials are declared in this module. For the included biogenic carbon, see the results chapter.

Module A4: Glavaflex is distributed only in Norway. The average transportation distance per declared unit was calculated based on the sales volume and average transportation distance. As a result, the average road transportation distance per declared unit is 1142 kilometres by road.

Module A5: Glavaflex is assembled by manual labour under use of adhesive. It is assumed that no further energy or materials are required in this module, and that consumers of Glavaflex order correct product sizes and thus avoid waste production during the assembly. The packaging materials are disposed of by re-using (cardboard and wooden pallet) and by incineration (polyethylene and polypropylene).

Module C2: The average distance of disassembled Glavaflex to the point of disposal is assumed to be 75 kilometres covered by road.

Module C4: Glavaflex is incinerated.

3.4 Cut-off criteria

All material flows in module A1 are covered and almost all material and energy flows in module A3 are covered. Neglected material or energy flows have a mass or energy contribution of less than one percent per process and contribute to less than 5% of mass and energy flows of a module. Infrastructure such as office buildings and the manufacturing hall as well as the machinery required to produce Glavaflex have not been considered.

3.5 Background data

The LCA model underlying this EPD was created in openLCA 1.8 developed by GreenDelta GmbH. As a background database /GaBi database/ professional database (version from July 2016) by thinkstep AG was used and has been complemented by data sets

from /GaBi database/ extension databases as well as data sets from the /EuGeos database/ 15804-IA database version 2.1 by EuGeos Ltd.

3.6 Data quality

The life cycle inventory for the assessed product is based on an internal assessment of manufacturing and environmental data, assessment of LCA-relevant data for the supply chain and energy measurement within the factors. The required product flows for creation of the product system were handed over to GreenDelta GmbH.

All data was scrutinised and found to be plausible and consistent and were therefore found to be representative.

Some of the background data sets are more than 10 years old but were used when no recent dataset was available. Datasets from the GaBi database are assumed to have a high quality.

There are no materials or processes that are left out because they are under the cut-off threshold.

3.7 Period under review

The production data refers to the average of the year 2018.

3.8 Allocation

During production, material cut-offs from Glavaflex are collected, shredded, and pressed. The pressed material is sold as a soundproofing material. Because it is composed of the exact same material as the main product, no allocation is considered. The soundproofing material is assumed to undergo the same life cycle as Glavaflex.

3.9 Comparability

Basically, a comparison or an evaluation of EPD data is only possible if all the data sets to be compared were created according to /EN 15804/ and the building context, respectively the product-specific characteristics of performance, are taken into account.

As a background database /GaBi database/ professional database (version from July 2016) by thinkstep AG was used and has been complemented by data sets from /GaBi/ extension databases as well as data sets from the /EuGeos database/ 15804-IA database version 2.1 by EuGeos Ltd..

4. LCA: Scenarios and additional technical information

The following technical scenario information serves as a basis for the declared modules. All values refer to the declared unit of 1 m².

Transport to the building site (A4)

Name	Value	Unit
Transport distance (road)	1142	km

Installation into the building (A5)

Name	Value	Unit
Auxiliary	1.6	kg
Water consumption	0	m ³
Other resources	0	kg
Electricity consumption	0	kWh
Other energy carriers	0	MJ
Material loss	0	kg
Output substances following waste treatment on site	16.5	kg

Dust in the air	0	kg
VOC in the air	0	kg

The 16.5 kg are the sum of all packaging materials per declared unit.

End of life (C1-C4)

Name	Value	Unit
Collected separately	49.95	kg
Collected as mixed construction waste	0	kg
Reuse	0	kg
Recycling	0	kg
Energy recovery	49.95	kg
Landfilling	0	kg

48.35 kg Glavaflex with 1.6 kg glue are incinerated for energy recovery.

**Reuse, recovery and/or recycling potentials (D),
relevant scenario information**

Module D includes the credits from the material re-use in module A5 and the credits of the incineration processes from A5 (packaging waste) and C4 at a waste incineration plant with an assumed efficiency of $R1 < 0.6$.

5. LCA: Results

The life cycle impact assessment method is based on EN15804. Energy indicators for resource use utilise the lower calorific value.

DESCRIPTION OF THE SYSTEM BOUNDARY (X = INCLUDED IN LCA; MND = MODULE NOT DECLARED)

PRODUCT STAGE		CONSTRUCTION PROCESS STAGE			USE STAGE							END OF LIFE STAGE				BENEFITS AND LOADS BEYOND THE SYSTEM BOUNDARIES
Raw material supply	Transport	Manufacturing	Transport from the gate to the site	Assembly	Use	Maintenance	Repair	Replacement	Refurbishment	Operational energy use	Operational water use	De-construction demolition	Transport	Waste processing	Disposal	Reuse-Recovery-Recycling-potential

Additional Technical scenario:

In module A3, a wooden EURO-pallet is used. 42.44kg CO₂ are absorbed per one pallet as biogenic carbon. In module A5, the pallet is re-used and thus counted as an avoided product. This means that the same amount of CO₂ is “released” in this module.

6. LCA: Interpretation

Environmental Impacts

All seven environmental impact categories are dominated by module A1 raw material supply. For global warming potential, ozone layer depletion, acidification potential, photochemical ozone creation potential, and abiotic depletion potential (fossil), the production of the blowing agent is the largest contributor. For the eutrophication potential, the largest contributor is the production of the vulcanisation agent. For the abiotic depletion potential for non-fossil resources it is the production of the flame retardant.

Renewable primary energy as energy carrier (PERE)

This impact category is dominated by the module A3 manufacturing. Most of the renewable energy is used in the production process of the EURO pallet and the carboard.

Renewable primary energy resources as material utilization (PERM)

The dominant modules are A3 manufacturing and the avoided burdens in module D.

Most of the renewable energy is stored in the wood of the EURO pallet and is 'released' in module D because of re-using.

Non-renewable primary energy as energy carrier (PENRE)

The dominant module is A2 because of the long transport distances and A3 assembly. Fuel is the main contributor for the transport.

Non-renewable primary energy as material utilization (PENRM)

The dominant module is A1 raw material supply, where energy is stored in the product itself.

Use of secondary material (SM)

The largest contributors is the module A1 raw material supply. The most secondary materials are used to produce the blowing agent.

Use of net fresh water (FW)

This impact category is dominated by module A1 raw material supply. The production of the blowing agent uses the most fresh water.

Hazardous waste disposed (HWD)

This impact category is dominated by modules A1 raw material supply and A2 transport.

Most of the hazardous waste comes from the production of the blowing agent for A1 and the fuel for A2.

Non-hazardous waste disposed (NHWD)

This impact category is dominated by module A1 raw material supply. The main contributors are the production of the base material and the flame-retardant.

Radioactive waste disposed (RWD)

This impact category is dominated by module A1 raw material supply. Most radioactive waste stems from the production of the base material, the blowing agent, and the base material.

Materials for recycling (MFR)

The lorry transport process includes recycling materials, mainly to produce trucks and roads. So, the transport modules show the highest impacts in this category.

Conclusion

The production of the blowing agent is the largest contributor to the environmental impacts of Glavaflex.

7. Requisite evidence

7.1 VOC emissions

The Volatile Organic Compound (VOC) emissions have been tested by /Eurofins/ Product Testing A/S by using the Committee for health-related evaluation of building products/Deutsches Institut für Bautechnik (/AgBB/DIBt/) test method in 09.2013.

AgBB overview of results (28 days [$\mu\text{g}/\text{m}^3$])

Name	Value	Unit
TVOC (C6 - C16)	<5	$\mu\text{g}/\text{m}^3$
Sum SVOC (C16 - C22)	<5	$\mu\text{g}/\text{m}^3$
R (dimensionless)	<1	-
VOC without NIK	<5	$\mu\text{g}/\text{m}^3$

Carcinogenic Substances	<1	$\mu\text{g}/\text{m}^3$
-------------------------	----	--------------------------

AgBB overview of results (3 days [$\mu\text{g}/\text{m}^3$])

Name	Value	Unit
TVOC (C6 - C16)	<5	$\mu\text{g}/\text{m}^3$
Sum SVOC (C16 - C22)	<5	$\mu\text{g}/\text{m}^3$
R (dimensionless)	<1	-
VOC without NIK	<5	$\mu\text{g}/\text{m}^3$
Carcinogenic Substances	<1	$\mu\text{g}/\text{m}^3$

7.2 Leaching performance

The concentration of water-soluble chloride ions is 300 mg/kg according to /EN 13468:2001/.
